27th August 2013

**2nd Session of
PUBLIC POLICY ADVISORY COMMITTEE
(PPAC)**

Effective Security

- It is basic that the unlawful content is just to be removed at the server it is hosted. When content is in the Country, it would be easy to mandate to that company hosting the server
- Unlawful content is as decided by Government agencies after following a due process
- There is need for close coordination/code of conduct to tackle such situation among economies
- Alternatively there are requirements of monitoring all internet flow at many locations to find the unlawful content and blocking

Local Content Hosting should help

Local hosting would help in

- Security would increase as Content does not touch the foreign shores thus can not be snooped
- Easy access to the location of hosting and transporting the content through all means including manual thus being economical and safe
- Price would reduce as there is less need to take International connectivity and would adjust with regional economic standards
- Content would be easily improved catering to Local administration needs and at a low incremental cost and in lesser time thus leading to proliferation of large no. of entrepreneurs opening up potential of large no of jobs

Thank You
