### Internet Traffic Volume (South Asia)

| Country     | Internet Users | <b>Broadband Users</b> | Traffic Volume |
|-------------|----------------|------------------------|----------------|
| Singapore   | 3.4M (72%)     | 1.0M                   | 415G           |
| Malaysia    | 17M (66%)      | 1.4M                   | 172G           |
| India       | 81M (7%)       | 5.3M                   | 160G           |
| Philippines | 24M (25%)      | 1.0M                   | 95G            |
| Thailand    | 16M (24%)      | 0.9M                   | 67G            |
| Vietnam     | 21M (25%)      | 2.5M                   | 45G            |
| Indonesia   | 30M (12%)      | 0.3M                   | 31G            |
| Pakistan    | 18M (11%)      | 0.2M                   | 18G            |
| Total       | 210M           | 12.6M                  | 1.0T           |

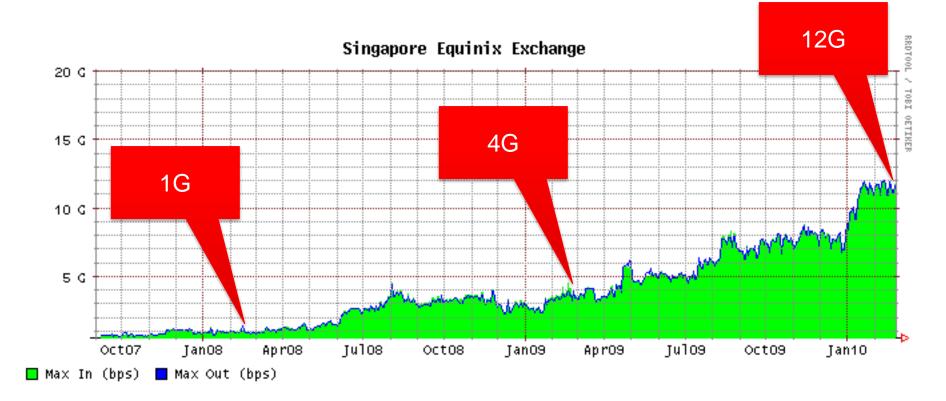

# ≈300Gbps of potential peering traffic

Source: http://www.internetworldstats.com/asia.htm

Source: Telegeography International Internet Bandwidth by Country 2009

#### Equinix Exchange Singapore

# 4% of potential peering traffic

#### Where is all the traffic?

Transmitted over other exchanges out of region?

- Transmitted over PNI?
- Transmitted over Transit links?
  - Via the US?

International Inbound ...

Can't find the right peering coordinators Lack of carrier concentration in data centers

In Region...

What is Peering?

Peering is too complicated

Peering is too expensive

It's easier to justify an upgrade existing transit capacity vs. new connectivity to peering platforms

Peering doesn't give me the SLA that I need

My IRU capacity is all structured to the USA

Any other reasons? How can we help?

## Equinix Updates Carrier Ethernet Exchange

March 3, 2010

- 1 Motivation for E-NNI fabric
- 2 Equinix Carrier Ethernet Exchange (EECE) Architecture
  - 1 Service Connectivity Mapping
  - 2 Service CoS and Bandwidth Mapping
  - 3 Ethernet OAM
- 3 ECEE Portal
- 4 Equinix Metro Ethernet Lab
- 5 ECEE Trials
- 6 ECEE Locations

## Why Do We Need E-NNI Aggregation?

- 1 NNI's traditionally have been set up as Bilateral agreements
  - Few in number
  - Complex business relationships
  - Each one may be different, both in business and technical terms
  - Difficult if you need an NNI just for one or a few customers
- 2 What has changed?
  - Carrier Ethernet standards
  - More carriers and Ethernet growth in Metro and WAN
  - Customer requirements: global and high bandwidth
    applications
  - Acknowledgement of scaling benefits of Internet model

## **Benefits of E-NNI Aggregation and Standards**

- 1 Setup many E-NNI's with more speed and less complexity
  - Easy to do a new E-NNI for a single customer or deal
  - Consider more options when looking for low cost of access
  - Reduce cost by aggregating inter-carrier relationships onto a single GigE or 10GigE port
  - Can still groom large E-NNI relationships to Bilateral

— Just like Internet peering

- 2 Standardized Carrier Ethernet Interconnection
  - Service/Product level standardization of E-NNI in Metro Ethernet Forum (currently in draft)
  - Better operational consistency
  - Troubleshooting and SLA Verification using OAM
  - Still allows carriers to differentiate their offering and SLAs

#### **NNI Marketplace Service Components**

EQUINIX

- 1 Recognize Carrier roles and bring them together
  - Buy side
  - Sell side
  - Wholesale
  - NNI's are usually one-way but can be bilateral buy/sell
- 2 Lit Building Lists
  - Standardized access drives the discovery of inventory
  - Building lists drive value: do you have the footprint I need?
- 3 SLAs
  - Carriers differentiate based on monitoring and guarantees

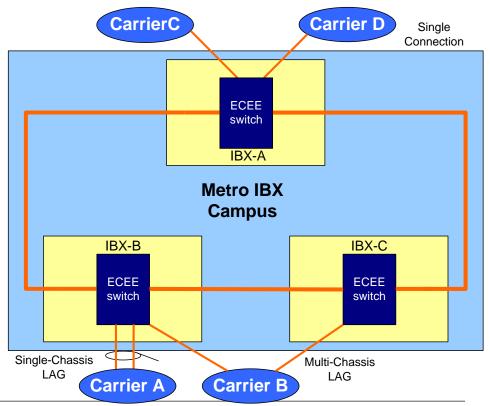

## **ECEE** Architecture

- 1 Service Interoperability Mapping
  - S-Tag, C-Tag, TPID, MTU, etc.
- 2 QoS and Bandwidth Control Mapping
  - 802.1p bits, Traffic Classes, Port and Service limits
- 3 OAM
  - Test continuity and service performance at NNI boundary
- 4 Self-serve Portal Automates E-NNI tasks such as
  - Interact with other carriers, search lit building lists
  - Req/Ack Virtual Service Connections
  - Conduct OAM testing
  - View port and logical connections and statistics

#### **ECEE Physical Connection Scenarios**

- Available Port Type
  - Gig-E port
  - 10Gig-E port
- Physical Connection Type
  - Single connection
  - Redundant Connections
    - Single Chassis LAG
      - Single chassis for redundant link connections (hot and stand-by)
    - Multi Chassis LAG
      - Multi chassis and multi link connections

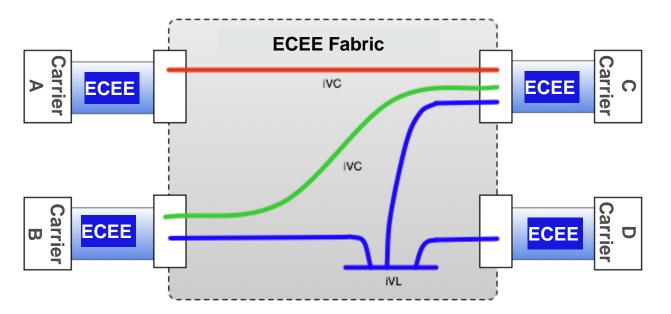

EQUINIX

#### **Service Logical Connection Scenarios**

- Point-to-Point Topology
- Multi-Point Topology
  - VPLS Protocol (LAN Environment)

| Recommend CoS traverse table for two different CoS networks ( <b>Right-<math>\rightarrow</math> Left</b> ) |                   |       |       |       |       |       |
|--|-------------------|-------|-------|-------|-------|-------|
| Classification Example   | 6 CoS             | 5 CoS | 4 CoS | 3 CoS | 2 CoS | 1 CoS |
| Class 6 (Voice, EF)  | 6                 | 5     | 4     | 2     | 2     |       |
| Class 5 (multimedia, AF4x)   | 5                 | 4     | 3     | 5     | 2     |       |
| Class 4 (Critical Data, AF3x)  | 4                 | 3     | 3     | 2     |       | 1     |
| Class 3 (Preferred Data, AF2x)   | 3                 | 2     | 2     | 2     | 1     | •     |
| Class 2 (Business Data, AF1x)  | 2                 | 2     | 2     | 1     |       |       |
| Class 1 (Best Effort, BE)  | 1                 | 1     | 1     |       |       |       |
|  | Traffic Direction |       |       |       |       |       |

#### Decomposed CoC traverse table for two different CoC potucrity (Displt ) 1 oft)

Recommend CoS traverse table for two different CoS networks (**Right**- $\rightarrow$  Left)

| 1 CoS | 2 CoS | 3 CoS          | 4 CoS | 5 CoS | 6 CoS                     | Classification Example         |
|-------|-------|----------------|-------|-------|---------------------------|--------------------------------|
|       | 2     | 2              | 4     | 5     | 6                         | Class 6 (Voice, EF)            |
|       | 2     | 5              | 3     | 4     | 5                         | Class 5 (multimedia, AF4x)     |
| 1     |       | 2              | 5     | 3     | 4                         | Class 4 (Critical Data, AF3x)  |
|       | 1     | 1 2 2<br>1 1 1 | 2     | 2     | 3                         | Class 3 (Preferred Data, AF2x) |
|       |       |                |       |       | 2                         | Class 2 (Business Data, AF1x)  |
|       |       |                | 1     | 1     | Class 1 (Best Effort, BE) |                                |
|       |       | Traffic        |       |       |                           |                                |

#### **Service Bandwidth Control Scenarios**

Principle of Service Bandwidth Control Method

• Operator should match or adapt to service provider's method to guarantee the service bandwidth

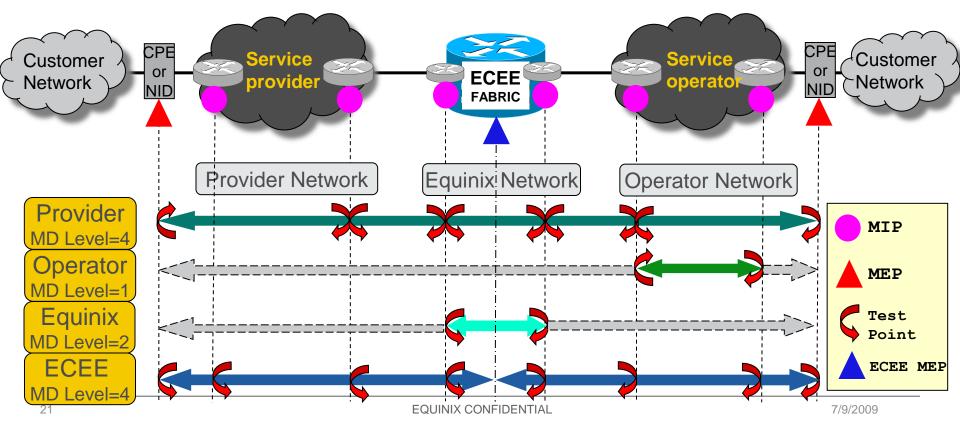

|           | Service Provider (end-to-end service owner) Bandwidth Control Method |   |   |   |                                  |                                  |  |  |  |  |
|-----------|--|---|---|---|----------------------------------|----------------------------------|--|--|--|--|
| Ser       |  | CIR   | Aggregate<br>(CIR+PIR)                  | Fixed<br>(CIR+PIR)                      | Aggregate,<br>Per Q CIR          | Fixed,<br>Per Q CIR              |  |  |  |  |
| vice Op   | CIR  | CIR to CIR                                  | Aggregate<br>(CIR+PIR) to<br>CIR        | Aggregate<br>(CIR+PIR) to<br>CIR        | Aggregate<br>bandwidth to<br>CIR | Aggregate<br>bandwidth to<br>CIR |  |  |  |  |
| erator (  | Aggregate<br>(CIR+PIR)   | CIR to CIR                                  | CIR to CIR,<br>PIR to PIR               | CIR to CIR,<br>PIR to PIR               | Aggregate<br>bandwidth to<br>CIR | Aggregate<br>bandwidth to<br>CIR |  |  |  |  |
| partial s | Fixed<br>(CIR+PIR)   | CIR to CIR                                  | CIR to CIR,<br>PIR to PIR               | CIR to CIR,<br>PIR to PIR               | Aggregate<br>bandwidth to<br>CIR | Aggregate<br>bandwidth to<br>CIR |  |  |  |  |
| ervice o  | Aggregate,<br>Per Queue<br>CIR                                       | CIR to Highest<br>Queue or one<br>of Queues | CIR to highest<br>Q, PIR to<br>lowest Q | CIR to highest<br>Q, PIR to<br>lowest Q | Queue on<br>Queue (s) map        | Queue on<br>Queue (s) map        |  |  |  |  |

## **Ethernet OAM (CFM)**

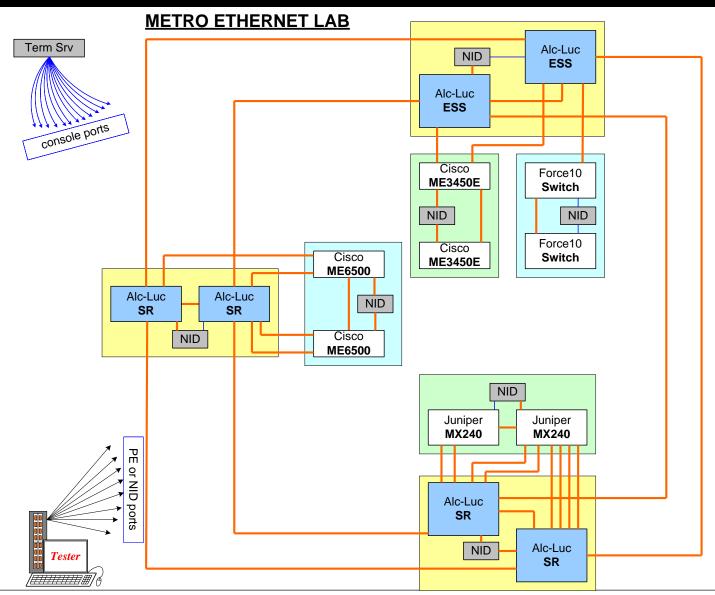

#### Service OAM (CFM)

- 802.1ag Configuration parameters
  - MD = service, MA = Service ID, MEP Level = 4, CCM with 10s interval
- CFM Features
  - Service connectivity check message (CCM)
  - Service loopback (LBM) test and send test traffic through loop to see loss, latency, jitter
  - Service link trace (LTM) test
- ECEE MEP
  - ECEE MEP will be available from ECEE portal for assisting activation and troubleshooting

#### **Equinix Metro Ethernet Lab Layout**

## **ECEE Locations**

#### Current Metros for Trial Program:

- Silicon Valley
- Chicago
- New York

#### Planned in 1H2010

- London
- Los Angeles

#### Planned in 2H2010

- Ashburn (Washington DC)
- Singapore/Tokyo/Hong Kong
- Paris/Frankfurt/Amsterdam
- 4 more "Phase 3" metros

#### Planned in 1H2011

• 5 more "Phase 4" metros

Trial qualification:

1.ECEE Carrier Trial Requirements
 2.ECEE Service Information Form

If you are interested in joining Trial program or learning more,
